

Solutions

Molarity

Mole solute/liters solution

The molar concentration of a solution, expressed as the number of moles of solute per liter of solution.

Homework & reading

- Chapter 18
- section 18.2 Questions 8-13

Problems

- sample molarity problems

Molarity problems

- Find the molarity:
 - 25.0 grams of NaCl mixed with water to make 2.50 liters of solution
 - 0.17 M
- Find the grams needed to make a 5.0 liter of 0.10 M solution of CaCl_2
 - 55 g CaCl_2

NaCl

$$\blacksquare \frac{25.0 \text{ g NaCl}}{1} \times \frac{1 \text{ mole NaCl}}{58.4 \text{ g NaCl}} = 0.428 \text{ mol}$$

$$\frac{0.428 \text{ mol}}{2.5 \text{ L}}$$

Molarity problems

- What volume of 3.0 M KOH is needed to have 1.5 moles of KOH?
- 0.50 L

Solution Dilution

- Often chemists need to dilute a stock solution (like concentrated acids)
- Once the required number of moles is known dilution is easy

Dilution spreads out the solute particles

Homogeneous and shades

Dilutions

- $\text{Molarity}_{\text{stock}} \times \text{Volume}_{\text{stock}} = \text{Molarity}_{\text{dilute}} \times \text{Volume}_{\text{dilute}}$

- $M_s \times V_s = M_d \times V_d$

OR

- $M_1 \times V_1 = M_2 \times V_2$

EXAMPLE PROBLEM

- Given a stock solution of 12 M HCl mix the following: A chemistry teacher needs 1750 mL of 0.1 M HCl solution. What volume of the stock HCl is required?
- $M_s = 12 \text{ M}$
- $V_s = X$
- $V_d = 1750 \text{ mL}$
- $M_d = 0.1 \text{ M}$
- Solve for V_s

$$V_s = \frac{M_d \times V_d}{M_s}$$

$$V_s = \frac{0.1 \text{ M} \times 1.750 \text{ L}}{12 \text{ M}}$$

$$V_s = 0.0146 \text{ L}$$
